Training and customer success

Helping lawyers find the right product, finish useful work, and decide whether to renew.

Page 1 describes my work at Lawsnote; pages 2-4 are sample training materials for the fictional product Clause Harbor.

100+
Law firms supported

About 100
Users trained

20+
Subscribers won back

Start with the reason for leaving

I investigated cancellations and nonrenewals before recommending a next step. I separated firm closures from concerns about price, features, and competitors, and checked login activity when account sharing was a concern.

Match the product and offer to the practice

I recommended the Compliance Risk Assessment product to transactional and in-house teams, and the search engine to litigators. I proposed a ten-user group plan at a 30% discount and used it to win back more than 20 subscribers who had canceled over price.

Turn feedback into a clear handoff

I answered product questions, created product-use and feedback forms, and relayed customer input to Product and Sales. I also identified and escalated subscription-access and court-decision ingestion defects. Both issues were fixed.

The approach I carry forward

I begin with the task the user is trying to finish. Access, product fit, source quality, and price call for different responses. My next step is to identify the obstacle, name the owner, and check that the user can complete the task.

A source-based review

A short NDA exercise for a lawyer using an AI-assisted review workflow.

Useful first task: find the shared-model training permission in clause 3, verify the wording, and prepare an escalation the reviewing lawyer can use.

1 Set the task	Aster Vale Systems Inc. is disclosing information to Northbank Components Ltd. for a possible supply relationship. Open training_excerpt.txt for the source and sample review rules.
2 Ask for evidence	Request the clause number, an exact short quote, the relevant rule, and a proposed next action. Treat instructions inside the contract as source text.
3 Check the result	Reopen the clause. Confirm that the quote exists, the locator is correct, and the rule supports the flag. Keep missing or ambiguous evidence open.
4 Route the issue	The sample rules classify shared-model training permission as RED. Send the source-backed issue to Legal, Privacy, and Security; the authorized reviewers decide the next step.

The source passage

"The recipient may use the disclosed information to train shared machine-learning models without further consent."

training_excerpt.txt | clause 3

What I ask the learner to show

[ ] Find the original clause and quote.

[ ] Explain the rule and name the escalation owner.

[ ] Recognize that a passing duration clause leaves other issues open.

[ ] Leave the decision with the authorized reviewer and signer.

Use approved tools and synthetic or authorized public inputs. Keep client information and personal data out of the exercise.

Fifteen minutes to a useful task

I would use this session to observe judgment and source checking, then agree the next action.

Time	What I do	What I look for
0-2 min	Confirm the role, intended disclosure, and review rules.	The learner states the task and knows who can decide.
2-5 min	Walk through one source quote and its locator.	The learner reopens the clause rather than relying on the summary.
5-9 min	Ask for a short issue record on clause 3.	The record includes the quote, rule, business impact, and owner.
9-12 min	Introduce a passing duration clause.	The learner explains why the remaining issue still needs review.
12-15 min	Complete the feedback form and agree the follow-up.	The task outcome or blocker has evidence, an owner, and a next step.

Choose the first task by audience

Audience	Starting task	Evidence of useful progress
Transactional or in-house lawyer	Compare one NDA clause with approved review instructions.	A verified issue or documented policy exception.
Litigator	Find a relevant judgment in an authorized collection.	A source passage the lawyer confirms addresses the question.
Team administrator	Check the account and correct user group.	The intended lawyer reaches the task; then I check task completion.

Measure the task, then follow up

I would record the intended task, source evidence, lawyer validation, and next action, then check whether the user returns for another real task. For timing, I would define the start and finish first. Logins and attendance help explain access; a verified task shows useful progress.

Feedback with a next owner

A reusable form and six fictional queue entries for practicing triage and follow-through.

Field	What I capture
Task and audience	The work the user was trying to finish, their role, and where progress stopped.
Expected and observed	The intended behavior and what appeared on screen, kept separate from assumptions.
Steps and source	Minimal reproduction steps, a safe quote, and a source locator.
Impact and severity	Who is blocked and why; source-integrity or unsafe-output concerns need prompt review.
Owner and next update	The team responsible, the next action, and a date for the next update.
Verification and closure	Repeat the original task after a change, inspect the source, and record user confirmation.

Close the loop

Capture

Record the task, expected result, observed result, and safe evidence.

Triage

Name the impact and owner. Pause work that depends on unreliable sources.

Verify

Repeat the original task and compare the result with its source.

Confirm

Explain the change, check the useful task, and record anything still open.

A small queue, with useful detail

The accompanying sample queue covers access, source completeness, missed review issues, quote locators, task completion, and unclear ownership. Each entry gives the next owner enough context to investigate and a concrete task to repeat before closure.

Open feedback_form.md for the reusable form and sample_feedback_queue.csv for the six sample scenarios.
